Fatty acid oxidation is the major pathway of energy generation in heart mitochondria, but very little is known of the metabolic enzymes of the process. The long term objective of this research is to study the enzymes of cardiac mitochondrial metabolism. The specific aims of this project are to:

- 1) purify the enzyme components that mediate fatty acid oxidation in mitochondrial inner membrane,
- 2) study their interaction at the protein and molecular level, and
- 3) identify and isolate their genes.

The fatty acid oxidation enzymes will be identified by direct purification of the enzymes and their subunits. By isolation of their genes and their restriction endonucleases, their primary structures can be determined. Studies of the amino acid sequences of the fatty acid oxidation enzymes and their relationship to other enzymes in fatty acid oxidation will indicate the sequence of events in the reaction and lead to better understanding of
