Creating a compatible file We show you a couple of important file-management ideas in Chapters 7 and 16, but they have more applications in image editing. After you create an image, you need to know how to store it. With a digital camera, you're likely to save images in JPEG format because it's the most common format, and it's easy to work with. But you need to store those pictures you take so you can edit them later, and that usually means in the TIFF format. You can convert JPEG images to TIFF using the Save for Web feature. You may even need to save pictures in the RAW format. When you have stored a file in an appropriate format, the next step is to make sure it's compatible with Photoshop. Because Photoshop is based on the raster system, you need to choose a file-type setting that's compatible with the way Photoshop works. Figure 1-3 outlines this compatibility. Figure 1-3: File-type settings determine the way a computer stores a digital image.
