Geospatial information systems (GIS) are an important and rapidly growing category of software. This category is loosely divided into geographic information systems (GIS), remote sensing (RS), and spatial database systems (SDS). More specifically, GIS

---

comprises systems for storing and managing data on the earth's surface. This data includes mapped areas, images, satellite imagery and representations of points, lines, or areas. GIS systems are used by governments, businesses, and individuals to manage, communicate and analyze real world data. The GIS system

---

should also have the ability to process, analyze and manipulate spatial information. The more specific categories (RS, SDS, etc.) all fall under the umbrella category of GIS. Social A mapping system designed for social networking in the form of a location-based software application that allows its users to upload, view, and

---

share their activity, interests, and relationship on a website or cell phone.

Mapping refers to the process of finding places on the earth's surface, determining where they are, and linking them in an orderly manner. A user's location on the globe is called a latitude-longitude (lat-long) coordinate. Coordinates are measured

---

in decimal degrees along the equator (e.g., 31.3746 N 89.7833 W) and meridians (e.g., 30.3863 N 89.9486 W). Spatial data refers to spatial coordinates of every feature in the world.

Spatial data can be categorized in four ways: Classifying data by building type: Eg. Churches, Hotels, Government buildings, etc.

---

Classifying by owner: Eg. Public, private, museum, etc. Classifying by content: Eg. Corporate, non-profit, hotels, etc. Classifying by use: Eg. Residential, commercial, industry, etc. Spatial database is a subset of geographic information systems. Spatial data is divided into three data sets: Geospatial data refers to spatial data

---

that are tagged, created, received, and stored in one of the three layers of the geospatial model: the earth's surface, the atmosphere, and space. A GIS can automatically create geospatial data from any type of data source, including aerial or satellite imagery, shapefiles, images, text, and native file formats.

---

# Ordinate refers to the horizontal and vertical coordinates of a point or
