Com - Las 7 claves del exito de disney libro completo pdfThe present invention relates to a bipolar semiconductor device. Bipolar transistors are devices of the type having both a p-type and an n-type semiconductor region. In general, a bipolar transistor includes a layer of n-type semiconductor material and a layer of p-type semiconductor material. Each layer is disposed on a layer of an insulator (e.g., silicon dioxide) or a semiconductor substrate. A layer of an n-type semiconductor material disposed on the layer of an insulator will comprise a first region of the transistor, called a base, and a layer of a p-type semiconductor material disposed on the layer of an insulator will comprise a second region, called an emitter. A layer of a p-type semiconductor material disposed on the layer of a semiconductor substrate will comprise a third region of the transistor, called a collector. Thus, the base and the collector are formed of n-type semiconductor material in the bipolar transistor, and the emitter and the collector are formed of p-type semiconductor material. In general, a bipolar transistor is formed on a semiconductor substrate. A semiconductor device, such as a bipolar transistor, is said to be "bipolar" because it includes two junction regions of different conductivity types disposed on a substrate. A voltage applied to the collector of the transistor produces a current flow from the base through the emitter to the collector. In such bipolar transistor, the emitter is used as a point of contact for a circuit to which the transistor is connected. It is desirable to design the emitter and the base of the bipolar transistor to operate in the radio-frequency (RF) region of the frequency spectrum. However, the RF characteristics of the base of the transistor may be deleteriously affected by the presence
