A photosensitive member used in electrophotographic copiers is often subjected to exposure under a DC voltage condition when used in such copiers and therefore has a potential of +1400 V or higher. This potential is a typical example of a so-called high-voltage potential. In the process of making an electrophotographic photosensitive member, the photosensitive member is treated with electrical charging to a high-voltage potential (1400 V or higher). Such a potential is applied to the photosensitive member in a pre-treating process (e.g., the preliminary charging). This pre-treating process is conducted to reduce a residual potential remaining after the photosensitive member is exposed to light, and if applied to the photosensitive member under conditions different from the conditions for the charging treatment, would cause uneven charging, abnormal discharge and even abrasion of the photosensitive member due to the repeated application of electrical discharges. To obviate these problems, the pre-charging is effected under conditions to which the photosensitive member will be subjected in the c6a93da74d
